Tutorial-3

1. Design the Data structure and write the algorithm to create/manage the action list for the following problem: the Processor is keeping record of all the actions taken by the user. If the user press "UnDo" the control should go to the last action to discard it, and if the user "REDO" the last action is to be redone.

2. Write an algorithm to print the index during which more than 300 automobiles were sold.

3. Write an algorithm to print each index and corresponding number of automobiles sold.
